

# Managing Wastewater Treatment Plant Impacts on Air Emissions

Zach Emerson, NCASI  
NCASI West Coast Regional Meeting  
September 28, 2016

# Outline

---

- ▶ Introduction
- ▶ Drivers & Standards
- ▶ Wastewater Fugitive Emissions Estimates
- ▶ Emissions Examples
  - ▶ Methanol
  - ▶ Hydrogen Sulfide
- ▶ Questions

# Drivers

---

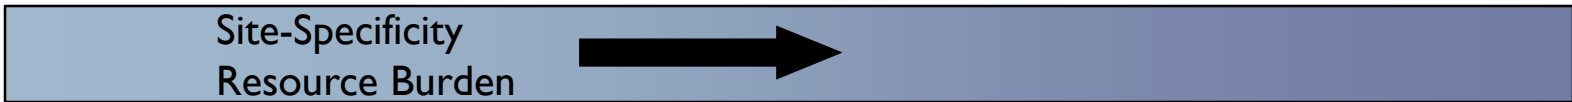

- ▶ Methanol
  - ▶ Hard-pipe option for MACT I compliance
    - ▶ 92% or > lb/ton of treatment
  - ▶ Clean Condensate Alternative for MACT II compliance
    - ▶ < X Lb/ton of emissions
  - ▶ Reporting
- ▶ Hydrogen Sulfide
  - ▶ Reporting
- ▶ Other Air Toxics
  - ▶ Ambient impact of wastewater fugitives
    - ▶ No real standard, maximum impact level
  - ▶ Reporting

# Introduction

---

- ▶ Fugitive emissions from wastewater treatment sources
  - ▶ Complex chemistry and biochemistry
  - ▶ Large wastewater systems
  - ▶ Load, operation and ambient conditions are variable
- ▶ As direct measurements are unfeasible, emissions must be estimated from empirical models
  - ▶ Emissions estimates can be tailored to be very site-specific

Site-Specificity  
Resource Burden

---

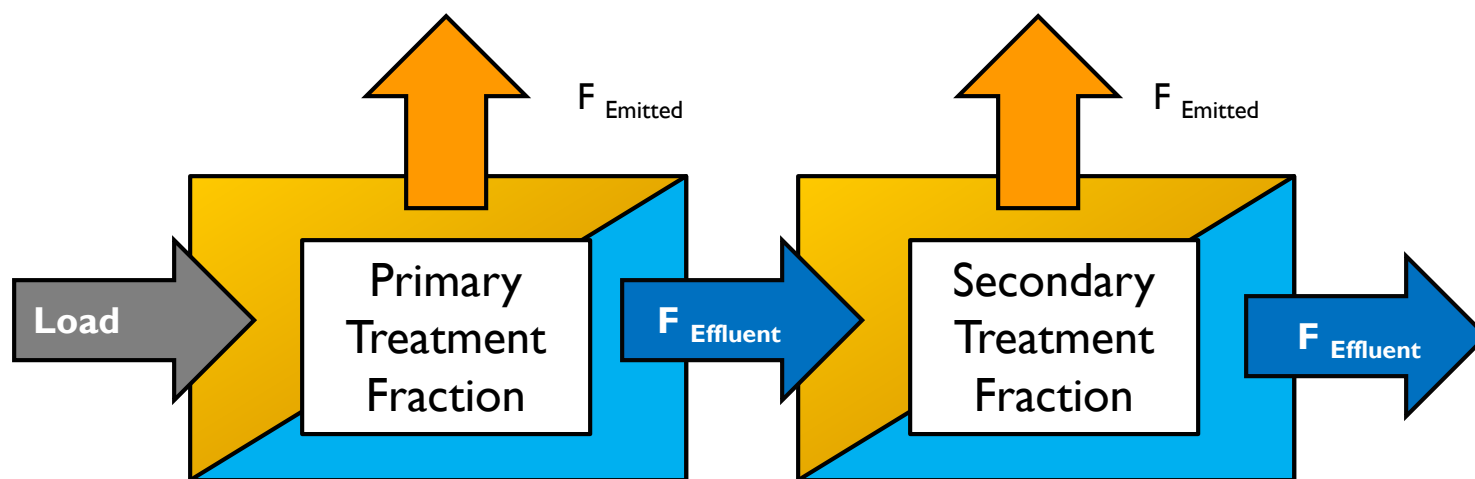

# Wastewater Treatment Plant Emissions

# Introduction – “Generic” Estimates

---

- ▶ Default estimation approach is emissions fraction based

- ▶ NCASI SARA Handbook presents emissions, effluent and removal fractions for many chemicals for a “typical” PC/ASB/AST
    - ▶ Most “air toxics”: Result of WATER9 Models
    - ▶ For methanol and  $\text{H}_2\text{S}$ : Result of field test data
-

# Introduction – Site-Specific Estimates

---

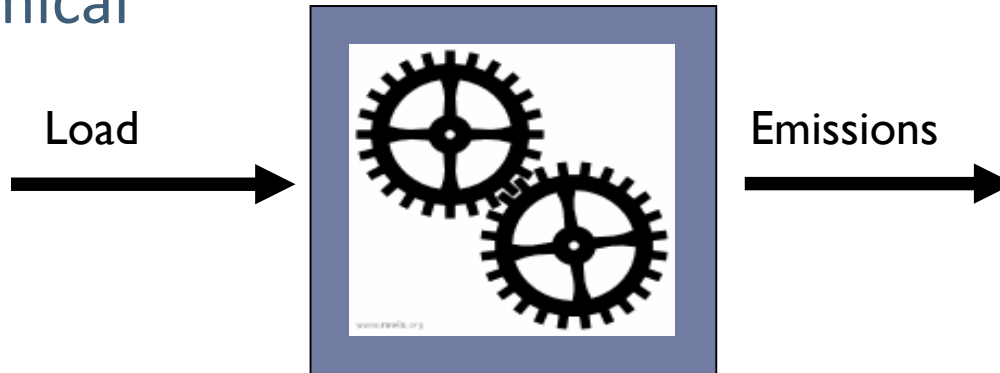

- ▶ Two Types of Estimation Approaches
  - ▶ Mechanistic Modeling
    - ▶ Simulation of the behavior of a chemical in a wastewater treatment process unit or set of units along multiple fate pathways
    - ▶ NOCEPM, WATER9, H2SSIM
  - ▶ Pond Profile Based Modeling
    - ▶ Characterization of chemical emissions based upon direct measurements of in-basin concentrations and concurrent operational information
    - ▶ Appendix C Approach

# Introduction – Mechanistic Modeling

---

- ▶ Mass-balance model that incorporates multiple pathways to simulate the site-specific behavior and fate of a chemical

- ▶ Requires WWTP characterization and declaration of biorate for each chemical
- ▶ Software Tools:
  - ▶ WATER9 & H2SSIM

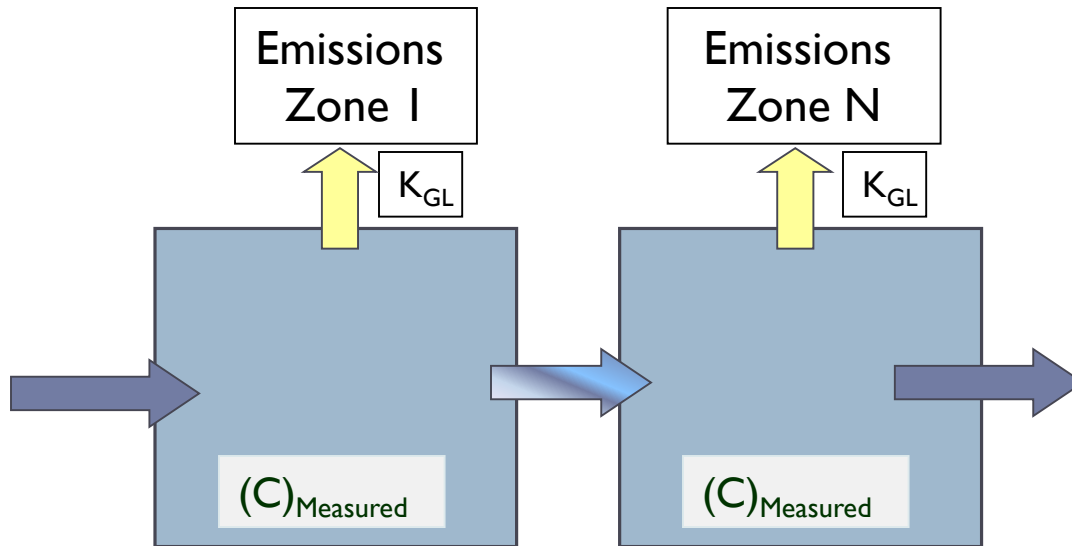

# Introduction – Profile-Based Modeling

---

- ▶ Appendix C calculation procedures
- ▶ Empirical model that combines chemical concentration profile with site-specific mass transfer estimates

- ▶ Results in a “snapshot”
- ▶ Requires chemical concentrations throughout WWTP, basin characterization
- ▶ Avoids the need for information on the biological destruction rate
- ▶ (Can be used to calculate)

# Methanol Issues

---

- ▶ Hard-pipe
  - ▶ Lower demonstrated treatment
- ▶ CCA
  - ▶ Higher emissions
- ▶ Issues are more often **not** related to treatment system performance
  - ▶ Methanol analysis
  - ▶ Calculation errors or changes
  - ▶ Collection issues
- ▶ Treatment issues may not be seen in monitoring of traditional effluent parameters
- ▶ May be localized to the primary hard-pipe treatment zone

# ASB - Methanol Example – Baseline

---

$$\text{Emissions} = K_{L,1} A_1 C_1 + K_{L,2} A_2 C_2 + K_{L,3} A_3 C_3 = 63.4 \text{ g/s}$$

$$F_{\text{bio}} = (\text{Influent} - \text{Effluent} - \text{Emissions}) / \text{Influent} = 0.954 = 95.4\%$$

# ASB - Methanol Example – Higher MeOH Concentration

$$\text{Emissions} = K_{L,1} A_1 C_1 + K_{L,2} A_2 C_2 + K_{L,3} A_3 C_3 = 139.4 \text{ g/s}$$

$$F_{\text{bio}} = (\text{Influent} - \text{Effluent} - \text{Emissions}) / \text{Influent} = 0.899 = 89.9\%$$

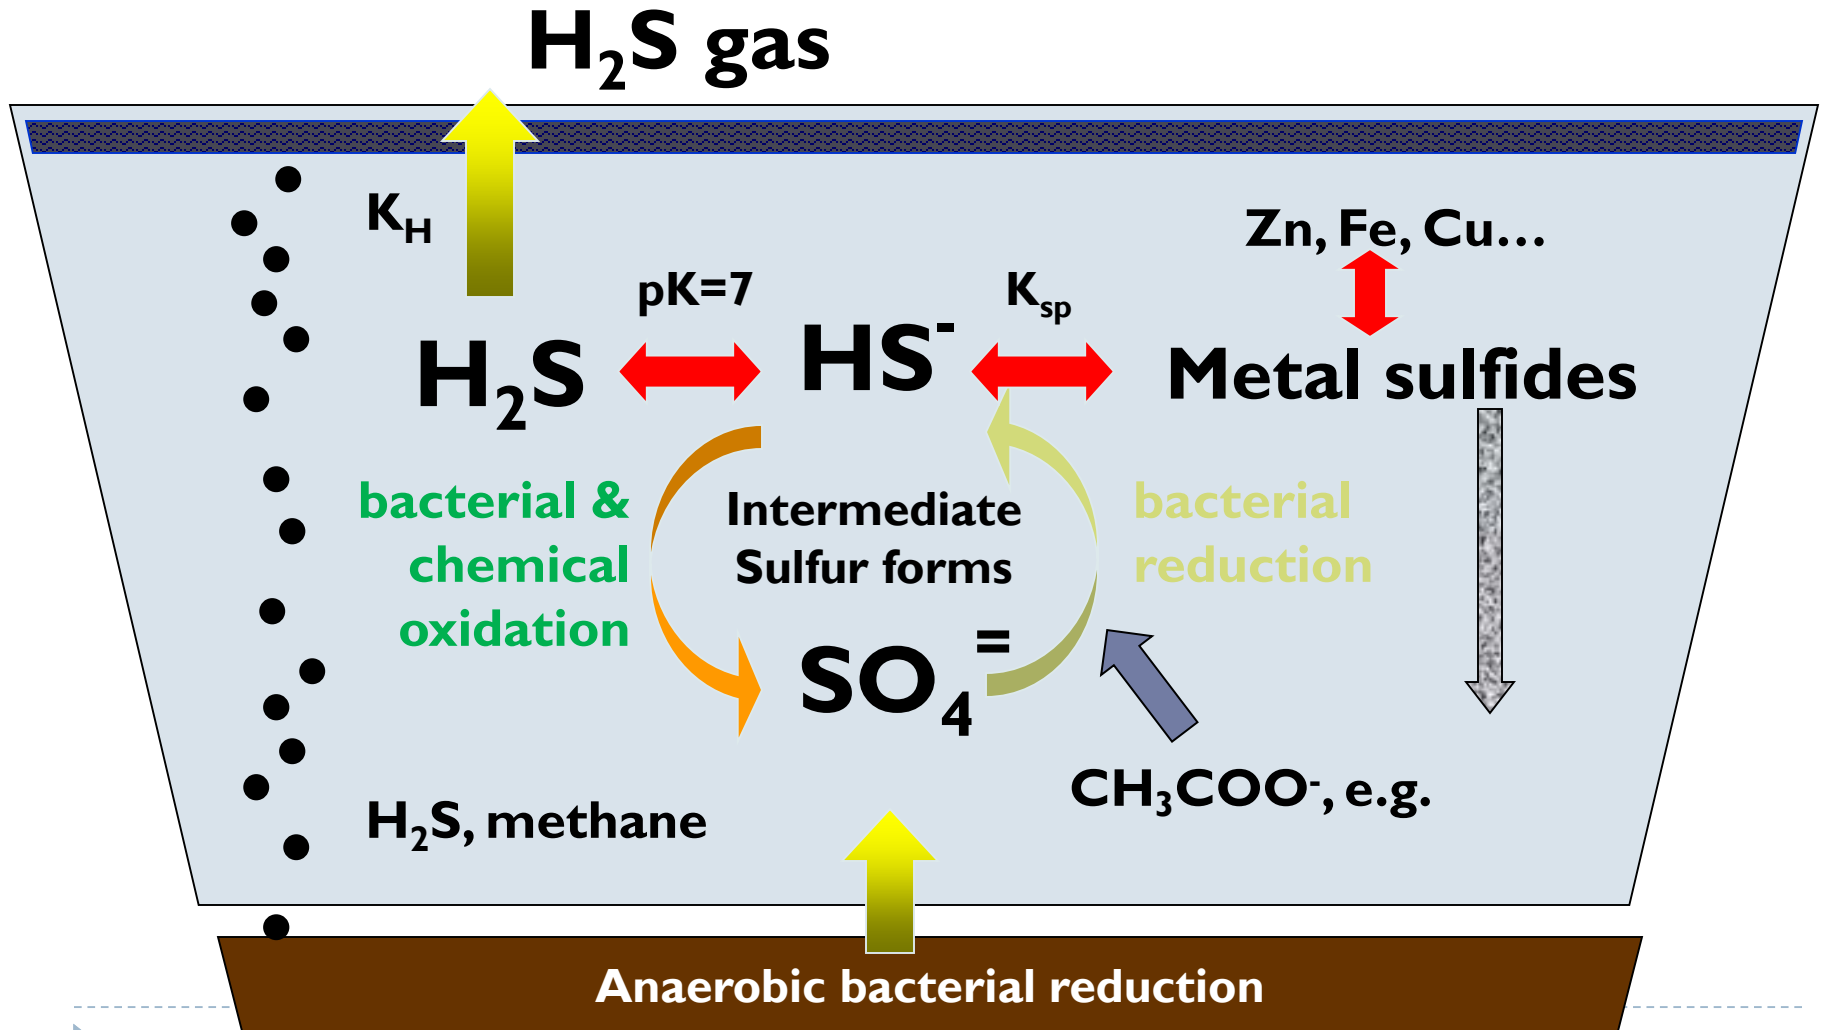

# Hydrogen Sulfide Issues

---

- ▶ Higher Emissions due to
  - ▶ Treatment system performance issues
  - ▶ Increase with lower pH
    - ▶ Emissions as "Free"  $H_2S$
  - ▶ Some systems can have sulfide generation due to anaerobic activity

# Sulfur Transformations in a Treatment Pond

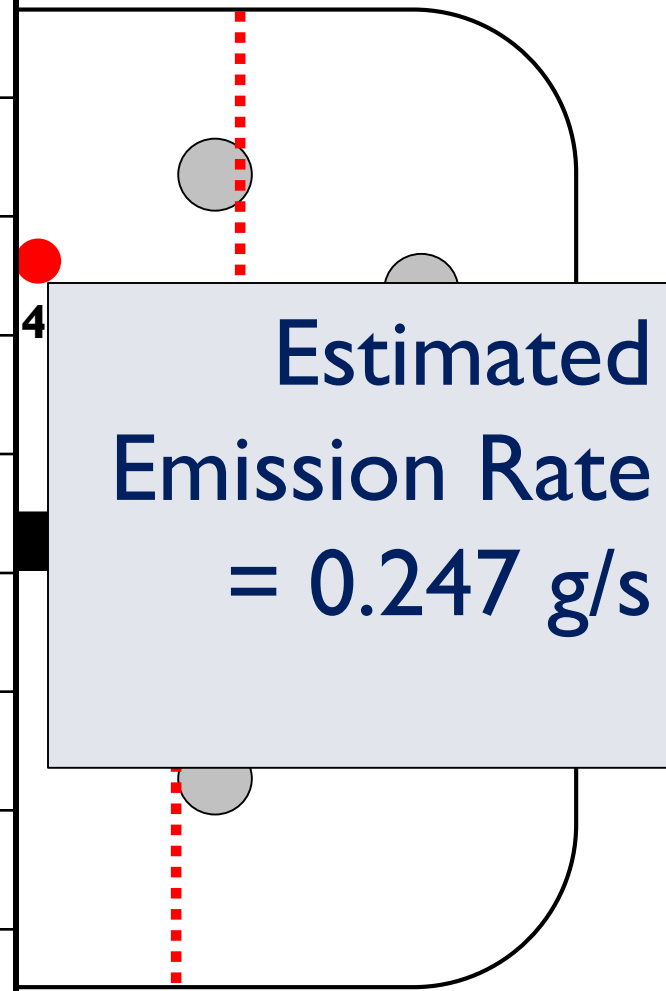

## H<sub>2</sub>S Emissions – Baseline emissions

	Sulfide	pH
<b>SP 1</b>	300 ppb	7.2
<b>SP 2</b>	300 ppb	7.2
<b>SP 3</b>	250 ppb	7.3
<b>SP 4</b>	100 ppb	7.4
<b>SP 5</b>	50 ppb	7.5
<b>SP 6</b>	<30 ppb	7.5
<b>SP 7</b>	<30 ppb	7.5
<b>Effluent</b>	< 30 ppb	7.5

## H<sub>2</sub>S Emissions – Lower pH

	Sulfide	pH
<b>SP 1</b>	300 ppb	6.7
<b>SP 2</b>	300 ppb	6.7
<b>SP 3</b>	250 ppb	6.8
<b>SP 4</b>	100 ppb	6.9
<b>SP 5</b>	50 ppb	7.0
<b>SP 6</b>	<30 ppb	7.3
<b>SP 7</b>	<30 ppb	7.5
<b>Effluent</b>	< 30 ppb	7.5

# H<sub>2</sub>S Emissions – Sulfide Generation

	Sulfide	pH
<b>SP 1</b>	300 ppb	7.2
<b>SP 2</b>	300 ppb	7.2
<b>SP 3</b>	250 ppb	7.3
<b>SP 4</b>	100 ppb	7.4
<b>SP 5</b>	150 ppb	7.5
<b>SP 6</b>	150 ppb	7.5
<b>SP 7</b>	300 ppb	7.5
<b>Effluent</b>	500 ppb	7.5

# Summary

## Best strategy to maintain emission levels

---

### ▶ Methanol

- ▶ Maintain good treatment

### ▶ Hydrogen Sulfide

- ▶ Maintain good treatment
- ▶ Avoid low pH spikes
- ▶ Avoid anaerobic conditions, especially in front of the system

# Questions and contact information
